# CERTIFICATE OF TEST

Last Date of Test: November 16, 2017

Kwikbit, Inc.

Model: M4-2000

## Radio Equipment Testing

### Standards

Specification	Method
FCC 15.407:2017	ANSI C63.10:2013, KDB 789033, KDB 662911

### Results

Method Clause	Test Description	Applied	Results	Comments
6.2	Powerline Conducted Emissions	Yes	Pass	
6.5, 6.6, 12.7	Spurious Radiated Emissions	Yes	Pass	
6.5 6.6, 12.7	Spurious Radiated Emissions – Intermodulation	Yes	Pass	
6.8	Frequency Stability	Yes	Pass	
12.2	Duty Cycle	Yes	N/A	Characterization of radio operation.
12.3.2.4	Maximum Conducted Output Power	Yes	Pass	
12.4.1	Emission Bandwidth	Yes	Pass	Applies to the 5.2 GHz band.
12.4.2	Occupied Bandwidth	Yes	Pass	Applies to the 5.8 GHz band.
12.4.2	Band Edge	Yes	Pass	
12.5	Maximum Power Spectral Density	Yes	Pass	
KDB 789033 -H	Measurement of Emission at Elevation Angle Higher Than 30 Degrees From Horizon	No	N/A	Not required per 15.407 (a)(1)(iii) for outdoor Point-to-point devices.

### Deviations From Test Standards

None

### Approved By:

Matt Nuernberg, Operations Manager

*Product compliance is the responsibility of the client; therefore, the tests and equipment modes of operation represented in this report were agreed upon by the client, prior to testing. The results of this test pertain only to the sample(s) tested. The specific description is noted in each of the individual sections of the test report supporting this certificate of test. This report reflects only those tests from the referenced standards shown in the certificate of test. It does not include inspection or verification of labels, identification, marking or user information.*

# ACCREDITATIONS AND AUTHORIZATIONS

---

## United States

**FCC** - Designated by the FCC as a Telecommunications Certification Body (TCB). Certification chambers, Open Area Test Sites, and conducted measurement facilities are listed with the FCC.

**A2LA** - Accredited by A2LA to ISO / IEC 17065 as a product certifier. This allows Element to certify transmitters to FCC and IC specifications.

**NVLAP** - Each laboratory is accredited by NVLAP to ISO 17025

---

## Canada

**ISED** - Recognized by Innovation, Science and Economic Development Canada as a Certification Body (CB). Certification chambers and Open Area Test Sites are filed with ISED.

---

## European Union

**European Commission** – Within Element, we have a EU Notified Body validated for the EMCD and RED Directives.

---

## Australia/New Zealand

**ACMA** - Recognized by ACMA as a CAB for the acceptance of test data.

---

## Korea

**MSIP / RRA** - Recognized by KCC's RRA as a CAB for the acceptance of test data.

---

## Japan

**VCCI** - Associate Member of the VCCI. Conducted and radiated measurement facilities are registered.

---

## Taiwan

**BSMI** – Recognized by BSMI as a CAB for the acceptance of test data.

**NCC** - Recognized by NCC as a CAB for the acceptance of test data.

---

## Singapore

**IDA** – Recognized by IDA as a CAB for the acceptance of test data.

---

## Israel

**MOC** – Recognized by MOC as a CAB for the acceptance of test data.

---

## Hong Kong

**OFCA** – Recognized by OFCA as a CAB for the acceptance of test data.

---

## Vietnam

**MIC** – Recognized by MIC as a CAB for the acceptance of test data.

---

## SCOPE

# MEASUREMENT UNCERTAINTY

## Measurement Uncertainty

When a measurement is made, the result will be different from the true or theoretically correct value. The difference is the result of tolerances in the measurement system that cannot be completely eliminated. To the extent that technology allows us, it has been our aim to minimize this error. Measurement uncertainty is a statistical expression of measurement error qualified by a probability distribution.

A measurement uncertainty estimation has been performed for each test per our internal quality document QM205.4.6. The estimation is used to compare the measured result with its "true" or theoretically correct value. The expanded measurement uncertainty (K=2) can be found included as part of the applicable test description page. Our measurement data meets or exceeds the measurement uncertainty requirements of the applicable specification; therefore, the test data can be compared directly to the specification limit to determine compliance. The calculations for estimating measurement uncertainty are based upon ETSI TR 100 028 (or CISPR 16-4-2 as applicable), and are available upon request.

The following table represents the Measurement Uncertainty (MU) budgets for each of the tests that may be contained in this report.

Test	+ MU	- MU
Frequency Accuracy (Hz)	0.0007%	-0.0007%
Amplitude Accuracy (dB)	1.2 dB	-1.2 dB
Conducted Power (dB)	0.3 dB	-0.3 dB
Radiated Power via Substitution (dB)	0.7 dB	-0.7 dB
Temperature (degrees C)	0.7°C	-0.7°C
Humidity (% RH)	2.5% RH	-2.5% RH
Voltage (AC)	1.0%	-1.0%
Voltage (DC)	0.7%	-0.7%
Field Strength (dB)	5.2 dB	-5.2 dB
AC Powerline Conducted Emissions (dB)	2.4 dB	-2.4 dB

# PRODUCT DESCRIPTION

## Client and Equipment Under Test (EUT) Information

<b>Company Name:</b>	Kwikbit, Inc.
<b>Address:</b>	7801 E Bush Lake Rd Suite 300
<b>City, State, Zip:</b>	Minneapolis, MN 55439
<b>Test Requested By:</b>	Tim Blom
<b>Model:</b>	M4-2000
<b>First Date of Test:</b>	August 15, 2017
<b>Last Date of Test:</b>	November 16, 2017
<b>Receipt Date of Samples:</b>	August 14, 2017
<b>Equipment Design Stage:</b>	Production
<b>Equipment Condition:</b>	No Damage
<b>Purchase Authorization:</b>	Verified

## Information Provided by the Party Requesting the Test

### Functional Description of the EUT:

The M4-2000 is a Non-Line-of-Sight (NLoS), wireless, point-to-point backhaul solution designed and optimized to serve street-level small cells. The M4-2000 contains two radio modules with two RF channels each (vertical and horizontal polarization). Each radio channel can operate up to 24 dBm of RF power. The product contains an integrated dual polarization patch antenna with ~20 dBi of gain. Power is supplied to the device thru a power over Ethernet (PoE) midspan.

### Testing Objective:

To demonstrate compliance of the radio under FCC 15.407 for operation in the 5.2 GHz and 5.8 GHz band(s).

## Equipment Modifications

Item	Date	Test	Modification	Note	Disposition of EUT
1	8/15/2017	Powerline Conducted Emissions	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
2	10/12/2017	Spurious Radiated Emissions - Intermodulation	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
3	10/16/2017	Spurious Radiated Emissions	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
4	10/20/2017	Emission Bandwidth	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
5	10/23/2017	Maximum Conducted Output Power	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
6	10/24//2017	Maximum Power Spectral Density	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
7	10/24/2017	Frequency Stability	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	EUT remained at Element following the test.
8	11/26/2017	Band Edge	Tested as delivered to Test Station.	No EMI suppression devices were added or modified during this test.	Scheduled testing was completed.

# POWERLINE CONDUCTED EMISSIONS

## TEST DESCRIPTION

Using the mode of operation and configuration noted within this report, conducted emissions tests were performed. The frequency range investigated (scanned), is also noted in this report. Conducted power line measurements are made, unless otherwise specified, over the frequency range from 150 kHz to 30 MHz to determine the line-to-ground radio-noise voltage that is conducted from the EUT power-input terminals that are directly (or indirectly via separate transformer or power supplies) connected to a public power network. Per the standard, an insulating material was also added to ground plane between the EUT's power and remote I/O cables. Equipment is tested with power cords that are normally used or that have electrical or shielding characteristics that are the same as those cords normally used. Typically those measurements are made using a LISN (Line Impedance Stabilization Network), the 50ohm measuring port is terminated by a 50ohm EMI meter or a 50ohm resistive load. All 50ohm measuring ports of the LISN are terminated by 50ohm. The test data represents the configuration / operating mode/ model that produced the highest emission levels as compared to the specification limit.

# SPURIOUS RADIATED EMISSIONS

PSA-ESCI 2017.06.01

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data. The test data represents the configuration / operating mode/ model that produced the highest emission levels as compared to the specification limit.

## MODES OF OPERATION

Transmitting 802.11 - channel 36 (5160 MHz) with 10 and 20 MHz channel bandwidths; channel 38 (5190 MHz) with 40 MHz channel bandwidth. 4-QAM, 16-QAM, 64-QAM, 256-QAM, and 1024-QAM modulation types.

Transmitting 802.11 - channel 147 (5735 MHz) and channel 169 (5845 MHz) with 10 MHz channel bandwidth; channel 147 (5735 MHz) and channel 168 (5840 MHz) with 20 MHz channel bandwidth; channel 151 (5755 MHz) and channel 166 (5830 MHz) with 40 MHz channel bandwidth. 4-QAM, 16-QAM, 64-QAM, 256-QAM, and 1024-QAM modulation types.

Transmitting 802.11 - channel 32 (5160 MHz), channel 39 (5195 MHz), channel 49 (5245 MHz), channel 147 (5735 MHz), channel 159 (5795 MHz), and channel 169 (5845 MHz) with 10 MHz channel bandwidth; channel 32 (5160 MHz), channel 40 (5200 MHz), channel 48 (5240 MHz), channel 147 (5735 MHz), channel 158 (5785 MHz), and channel 168 (5840 MHz) with 20 MHz channel bandwidth; channel 38 (5190 MHz), channel 46 (5230 MHz), channel 151 (5755 MHz), channel 159 (5795 MHz), and channel 166 (5830 MHz) with 40 MHz channel bandwidth. 4-QAM, 16-QAM, 64-QAM, 256-QAM, and 1024-QAM modulation types.

Transmitting 802.11 - channel 32 (5160 MHz), channel 39 (5195 MHz), channel 49 (5245 MHz), channel 147 (5735 MHz), channel 159 (5795 MHz), and channel 169 (5845 MHz) with 10 MHz channel bandwidth. 4-QAM modulation type.

## POWER SETTINGS INVESTIGATED

30.0 - 1000	100.0	120.0	120.0
Above 1000	1000.0	N/A	1000.0

## TEST DESCRIPTION

The highest gain antenna of each type to be used with the EUT was tested. The EUT was configured for the required transmit frequencies in each operational band and the modes as showed in the data sheets.

For each configuration, the spectrum was scanned throughout the specified range as part of the exploratory investigation of the emissions. These "pre-scans" are not included in the report. Final measurements on individual emissions were then made and included in this test report.

The individual emissions from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antenna in three orthogonal axis if required, and adjusting the measurement antenna height and polarization (per ANSI C63.10). A preamp and high pass filter (and notch filter) were used for this test in order to provide sufficient measurement sensitivity.

Measurements were made with the required detectors and annotated on the data for each individual point using the following annotation:

QP = Quasi-Peak Detector  
PK = Peak Detector  
AV = RMS Detector

Measurements were made to satisfy the specific requirements of the test specification for out of band emissions as well as the restricted band requirements.

If there are no detectable emissions above the noise floor, the data included may show noise floor measurements for reference only.

Measurements at the edges of the allowable band may be presented in an alternative method as provided for in the ANSI C63.10 Marker-Delta method. This method involves performing an in-band fundamental measurement followed by a screen capture of the fundamental and out-of-band emission using reduced measurement instrumentation bandwidths. The amplitude delta measured on this screen capture is applied to the fundamental emission value to show the out-of-band emission level as applied to the limit.

Some measurements at the edges of the allowable band may also have been made using the integration method detailed in section 12.7.4.4.3 of ANSI C63.10. These will be denoted in the individual comments for each data point.

# SPURIOUS RADIATED EMISSIONS

EmiRS 2017.07.11 PSA-ESCI 2017.06.01

Work Order:	MAX40003	Date:	10/16/17	
Project:	None	Temperature:	21.4 °C	
Job Site:	MN05	Humidity:	35.5% RH	
Serial Number:	33	Barometric Pres.:	1026 mbar	Tested by: Dustin Sparks
EUT:	M4-2000			
Configuration:	1			
Customer:	Kwikbit, Inc.			
Attendees:	Tim Blom			
EUT Power:	110VAC/60Hz			
Operating Mode:	Transmitting 802.11 - channel 32 (5160 MHz), channel 39 (5195 MHz), channel 49 (5245 MHz), channel 147 (5735 MHz), channel 159 (5795 MHz), and channel 169 (5845 MHz) with 10 MHz channel bandwidth; channel 32 (5160 MHz), channel 40 (5200 MHz), channel 48 (5240 MHz), channel 147 (5735 MHz), channel 158 (5785 MHz), and channel 168 (5840 MHz) with 20 MHz channel bandwidth; channel 38 (5190 MHz), channel 46 (5230 MHz), channel 151 (5755 MHz), channel 159 (5795 MHz), and channel 166 (5830 MHz) with 40 MHz channel bandwidth. 4-QAM, 16-QAM, 64-QAM, 256-QAM, and 1024-QAM modulation types.			
Deviations:	None			
Comments:	Emissions initially characterized using radio 1, worst case emissions repeated using radio 2 (see comments).

# SPURIOUS RADIATED EMISSIONS

PSA-ESCI 2017.06.01

# SPURIOUS RADIATED EMISSIONS - INTERMODULATION

PSA-ESCI 2017.06.01

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data. The test data represents the configuration / operating mode/ model that produced the highest emission levels as compared to the specification limit.

## MODES OF OPERATION

Transmitting 802.11 - channel 36 (5160 MHz), channel 49 (5245 MHz), channel 147 (5735 MHz), and channel 169 (5845 MHz). 4-QAM modulation type. Radio 1 and radio 2 transmitting simultaneously.

Transmitting 802.11 - channel 32 (5160 MHz), channel 39 (5195 MHz), and channel 49 (5245 MHz). 4-QAM modulation type. Radio 1 and radio 2 transmitting simultaneously.

Transmitting 802.11 - channel 147 (5735 MHz), channel 159 (5795 MHz), and channel 169 (5845 MHz) with 10 MHz channel bandwidth; channel 147 (5735 MHz), channel 157 (5785 MHz), and channel 168 (5840 MHz) with 20 MHz channel bandwidth; channel 151 (5755 MHz), channel 159 (5795 MHz), and channel 166 (5830 MHz) with 40 MHz channel bandwidth. 4-QAM, 16-QAM, 64-QAM, 256-QAM, and 1024-QAM modulation types. Radio 1 and radio 2 transmitting simultaneously.

## POWER SETTINGS INVESTIGATED

110VAC/60Hz

## CONFIGURATIONS INVESTIGATED

MAX40003 - 1

## FREQUENCY RANGE INVESTIGATED

Start Frequency	30 MHz	Stop Frequency	40 GHz
-----------------	--------	----------------	--------

## SAMPLE CALCULATIONS

Radiated Emissions: Field Strength = Measured Level + Antenna Factor + Cable Factor - Amplifier Gain + Distance Adjustment Factor + External Attenuation

## TEST DESCRIPTION

The highest gain antenna of each type to be used with the EUT was tested. The EUT was configured to transmit two channels simultaneously, either from the same UNII band or one from each of the two available UNII bands.

For each configuration, the spectrum was scanned throughout the specified range as part of the exploratory investigation of the emissions. These “pre-scans” are not included in the report. Final measurements on individual emissions were then made and included in this test report.

The purpose of the test is to insure that no additional signals are creating by having multiple carriers in the passband of the EUT. The individual emissions from the EUT were maximized by rotating the EUT on a turntable, adjusting the position of the EUT and EUT antenna in three orthogonal axis if required, and adjusting the measurement antenna height and polarization (per ANSI C63.10). A test receiver was used to take the individual measurements in order to provide enough dynamic range while closer to the transmit bands. A preamp and high pass filter (and notch filter) were used for this test in order to provide sufficient measurement sensitivity during the pre-scans.

Measurements were made with the required detectors and annotated on the data for each individual point using the following annotation:

QP = Quasi-Peak Detector  
PK = Peak Detector  
AV = RMS Detector

Measurements were made to satisfy the specific requirements of the test specification for out of band emissions as well as the restricted band requirements.

If there are no detectable emissions above the noise floor, the data included may show noise floor measurements for reference only.

# FREQUENCY STABILITY

XMI 2017.09.21

Testing was performed using the mode(s) of operation and configuration(s) noted within the report. The individuals and/or the organization requesting the test provided the modes, configurations and settings used to complete the evaluation. The actual test parameters are specified in the test data, this includes items such as investigated frequency range (scanned) and test levels. The testing methods and performance specifications, as well as the test site used for the evaluation are indicated in the test data.

Analyzer - Spectrum Analyzer	Agilent	E4440A	AAX	16-Mar-17	16-Mar-18

## TEST DESCRIPTION

The measurement was made using a direct connection between the RF output of the EUT and a spectrum analyzer. The spectrum analyzer is equipped with a precision frequency reference that exceeds the stability requirement of the EUT.

Measurements were made at the edges of the main transmit bands as called out on the data sheets. Testing was done with an absence of modulation in a CW mode of operation.

The primary supply voltage was varied from 85 % to 115% of the nominal voltage. Using a temperature chamber, the transmit frequency was recorded at the extremes of the specified temperature range (-30 ° to +50° C) and at 10°C intervals.

Where a ppm limit applies:  $\text{ppm} = (\text{Measured Frequency} / \text{Measured Nominal Frequency} - 1) * 1,000,000$

Per the requirements of FCC 15.407:

"Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual."

No specific limits are provided in either FCC 15.407, the product specific rule part, or FCC 2.1055, the equipment authorization procedure for testing frequency stability. While there are no limits called out, any results less than 100ppm will still allow the radio to be operating within the band.

# DUTY CYCLE

## TEST DESCRIPTION

---

The Duty Cycle (x) were measured for each of the EUT operating modes. The measurements were made using a zero span on the spectrum analyzer to see the pulses in the time domain. The transmit power was set to its default maximum.

The duty cycle was calculated by dividing the transmission pulse duration (T) by the total period of a single on and total off time.

The EUT operates at 100% Duty Cycle.
